

## Permanently eliminate mold

The **TerraCalor** heating foil is a proven solution against mold in living spaces, which can even be used in damp rooms thanks to low-voltage technology. It is so convincingly simple that it opens up interesting growth markets for many finishing trades and is therefore an ally in the fight for better utilization and returns, especially for painters, plasterers, drywallers and tilers.

The foil heating is extremely thin and is hidden invisibly under plaster, in the floor or under tiles. At the push of a button, long-wave radiant heat is created that effectively tackles the problem of mold at its root and not only ensures healthy, spore-free breathing air, but also a pleasant feel-good climate.

### Permanently eliminate mold:

Mold remediation and mold removal are no problem in the long term with TerraCalor. Treat the areas with our Nano Protect and then install **TerraCalor** in the floor, ceiling or wall. The installation can be used selectively but really makes sense as a surface heating system. This gives you new, healthy living space.
